Custom HogZilla® Thrown Object Restraint Systems

INDUSTRIAL GRINDERS

CW Mill Equip. has gone to great lengths to design numerous multifunctional Tub Cover & Back Stop options based on input from experienced grinding professionals. With varying job sites, applications, and loading methods, systems can be customized.

For confined space applications, customers can choose from a variety of different thrown object restraint devises including their preferred remote controlled, adjustable tub cover variation. CW's Side-Slide combination Tub Cover & Back Stop Assembly allows the operator to better reduce possible thrown objects through a huge guard that can hydraulically adjust from a high and wide position to a fully enclosed position for clean out. The adjustment is smooth and easy from the control panel or a wireless remote control. Rigid stationary, non-adjusting, & loader maneuvered variations are also available.

Note: Restraint systems can reduce thrown object hazards, but some hazards are not able to be fully eliminated. Safety zones must always be established, maintained, and monitored. Some locations may not be conducive to grinding even with a restraint system. Proper machine maintenance and sorted grindable input material are always major requirements in minimizing thrown object hazards. Always be sure to follow recommended machine safety precautions. Some options may influence performance, safety, weight, and portability of the machine.

CW has designed variations that combine a Tub Cover & Back Stop into one assembly allowing the operator to reduce possible thrown object hazards more through a huge guard that can hydraulically adjust from a high and wide position to a fully enclosed position. Optional hydraulic adjustment is smooth and easy from control panel or wireless remote control.

The variation shown above hydraulically moves and adjusts in 3 ways including a long side travel to ensure that the guard does not become an interference point in applications where material might branch out of the tub. The massive mount structure and framework is built to last. Heavy-duty tubing constructs the base and provides the firm foundation for the assembly.

The guard's size, adjustment, and covering can be manufactured to the customer's specifications based on their application and preferences, and there are many other custom variations available.
