

Remote Control & Hydrostatic Tracks

INDUSTRIAL GRINDERS

Most other grinders require the operator to shut the grinder down and tow it to a new location.

Hydrostat Pumps driven off the front of the engine make it self-propelled.

A Remote Controlled Dual Hydrostatic Drive is used to drive the tracks allowing for a one-man operation.

The loader/excavator operator can stay in the cab while moving the HogZilla to different locations.

Hydrostatic Tracks allow easier navigation in tight areas.
